

VOD SEGMENTER: PREMISES™ File to File Transcoder

File to file transcoding automatically transcodes available files to file formats needed by broadcast servers, editing systems, web, and mobile devices. With this unique system, we've applied DVEO's deep experience with live encoding to file to file encoding, to create a formatter for Apple iOS, Linux, Android, Windows, or any device.

- Prepares multiformat content for VOD on multiple devices -- Encodes all profiles simultaneously
- If needed encodes files faster than real time -- about one-fifth the playing time of the video file
- Accepts files via drag and drop and repackages them to multiple encoded HLS segment files, at the requested bitrates and resolutions
- Includes fMP4 segment file support, which means distribution may utilize a single segment for both HLS and DASH clients
